

Custom HDF Doug Fir Beams are built using a 1"x30"x240" long sheet (shown partially above) that is cut/mitered to the customers specification ( $\frac{1}{2}''$  increments). Each custom beam is unique just as real beams are. This also applies to HDF Samples that are produced. Each 4"x4" sample is unique. The samples color and texture will vary depending on where the samples were cut from the beam/sheet. Volterra stain/color is a hand applied application and will also vary from part to part and batch to batch.
